 linux commands Linux For Beginners Guide To Learn Linux Command Line, Linux Operating System And Linux Commands Introduction I want to tell you a story. No, not the story of how, in 1991, Linus Torvalds wrote the first version of the Linux kernel. You can read that story in lots of Linux books. Nor am I going to tell you the story of how, some years earlier, Richard Stallman began the GNU Project to create a free Unix-like operating system. That's an important story too, but most other Linux books have that one, as well. No, I want to tell you the story of how you can take back control of your computer. When I began working with computers as a college student in the late 1970s, there was a revolution going on. The invention of the microprocessor had made it possible for ordinary people like you and me to actually own a computer. It's hard for many people today to imagine what the world was like when only big business and big government ran all the computers. Let's just say, you couldn't get much done. Today, the world is very different. Computers are everywhere, from tiny wristwatches to giant data centers to everything in between. In addition to ubiquitous computers, we also have a ubiquitous network connecting them together. This has created a wondrous new age of personal empowerment and creative freedom, but over the last couple of decades something else has been happening. A few giant corporations have been imposing their control over most of the world's computers and deciding what you can and cannot do with them. Fortunately, people from all over the world are doing something about it. They are fighting to maintain control of their computers by writing their own software. They are building Linux. Many people speak of "freedom" with regard to Linux, but I don't think most people know what this freedom really means. Freedom is the power to decide what your computer does, and the only way to have this freedom is to know what your computer is doing. Freedom is a computer that is without secrets, one where everything can be known if you care enough to find out. Why Use The Command Line? Have you ever noticed in the movies when the "super hacker," -you know, the guy who can break into the ultra-secure military computer in under thirty seconds - sits down at the computer, he never touches a mouse? It's because movie makers realize that we, as human beings,

instinctively know the only way to really get anything done on a computer is by typing on a keyboard! Most computer users today are only familiar with the graphical user interface (GUI) and have been taught by vendors and pundits that the command line interface (CLI) is a terrifying thing of the past. This is unfortunate, because a good command line interface is a marvelously expressive way of communicating with a computer in much the same way the written word is for human beings. It's been said that "graphical user interfaces make easy tasks easy, while command line interfaces make difficult tasks possible" and this is still very true today. Since Linux is modeled after the Unix family of operating systems, it shares the same rich heritage of command line tools as Unix. Unix came into prominence during the early 1980s (although it was first developed a decade earlier), before the widespread adoption of the graphical user interface and, as a result, developed an extensive command line interface instead. In fact, one of the strongest reasons early adopters of Linux chose it over, say, Windows NT was the powerful command line interface which made the "difficult tasks possible"

Linux has been well-known as one of the most powerful operating systems in the world of cybersecurity and coding. Among its various components, Kali Linux is one of the distributions which can be treated like a boon for ethical hackers and IT people. However, everything comes with several problems. In this world of today, people have excessive trust in Kali Linux capabilities by default only. As a result, most users are not paying attention to the various manual aspects of Linux security. It is true that with Linux, you can automate many of your tasks. However, it also requires some manual touch for keeping everything with the pace. This fact even becomes more evident when it comes to the concept of security. Though an operating system might automate all your tasks, it is your task to be anxious always. You are required to keep a close eye on the settings of our application and various other details. When you have a well-configured Kali Linux system, it might turn out to be the most difficult thing to crack. However, most Kali Linux users do not have profound knowledge about what is required for keeping their whole systems locked up. If you start using a brand-new application, try to pay very close attention to its configuration details. Running the application with the same example settings and then using it is not the ideal option. It is not at all recommended. Some of the developers in the past also put decoy settings in the applications to make sure that the applications are prevented from running. This was a great way to ensure that all the users have checked out the file of a configuration of the application. When it comes to permissions, it forms an essential part of Linux. It is essential for a user to clearly understand how every permission functions and the implications of the various components of the OS. If you are shifting from Windows to Linux, the generalized concept might be a bit different and awkward for you. The general rule of Kali Linux is that you are not supposed to use root for your daily work. This might sound like a bit of a surprise for all the Windows users in which the operating system handles the various permissions,

which are critical in nature in a different way. It is surely an inconvenient function to type a password each time you want the machine to execute a function.
